

## Thompson Landscape Company Six Step Fertilizer Program

### STEP ONE

Early spring application of pre-emergent crabgrass control with fertilizer. Most annual weedy grasses can be controlled before they emerge.

### STEP TWO

Slow release fertilizer applied with second application of crabgrass control. Broadleaf weeds sprayed if present.

### STEP THREE

Mid-summer application to maintain color through the summer. Grub control can be added to this application or Step Two for extra protection. Recommended only if lawn is irrigated regularly.

### STEP FOUR

A heavy September application of fertilizer after hot temperatures begin to moderate. Replenish reserves used during the heat and promote recovery from summer stress.

### STEP FIVE

A liquid application in October with a wide-spectrum herbicides. October is optimal time to attach the toughest broadleaf weeds like ground ivy, clover, and violet. Far superior to spring weed control.

### STEP SIX

A winterizer high in nitrogen to promote storage, root growth and early spring green up.

If you choose Thompson Landscape Company's Six-Step Program, your services are guaranteed. If at any time you are dissatisfied, contact us immediately. We will continue to work on your lawn until you are satisfied. If satisfactory results are not achieved, we will refund your most recent application.

Every lawn is unique; we can customize our programs to fit your needs and budget. Our extra services include insect control and aeration.
